**Group no: 14**

Vulnerability Type:
Functional

Description: No OTP verification was done during registration but it was required in the project requirement document.

Steps to Reproduce:
1)   Go to the url: https://192.168.2.246/signup/
2)   Register a user with any valid email (eg: abc1@gmail.com) and username (eg: abc1).
3)   No otp is requested or send to verify or validate the user.

Proof of Concept: I created a new account and then i got registered with no otp verification.
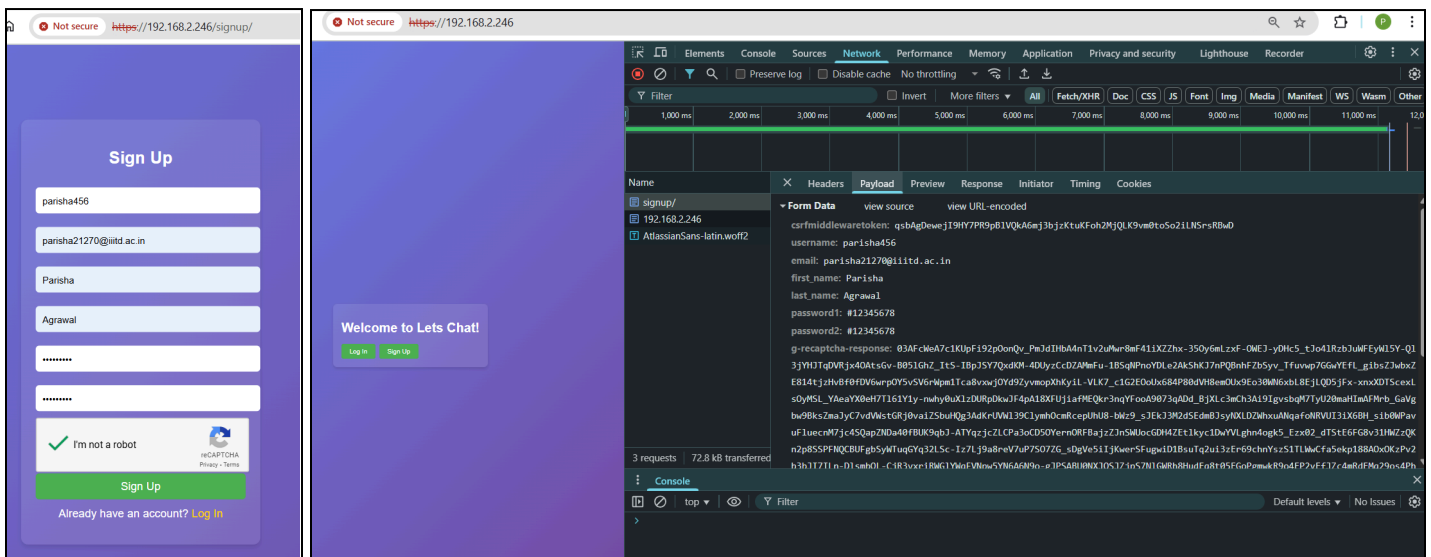

Impact:
This violates the requirement of user identity and validation in the document and thus leads to weak user verification and possible spam account creation.
